DVP – WEEK 12

CI/CD Pipeline with Jenkins, SonarQube and Docker

Submission evidence report

Project repository: github.com/vijayragaw/DVP-Week12-SonarQube-Docker

Prepared: 01 November 2026

This report documents the parts of the assignment that have been configured or tested, using screenshots from the working environment. The Docker Hub image push is reported separately as an outstanding issue.

Submission status

Completed / evidenced

• GitHub project repository and Jenkins source configuration.
• GitHub webhook configuration evidence.
• Jenkins role-based access configuration evidence.
• Maven/SonarQube analysis execution completed successfully in Jenkins build #21.
• SonarQube project dashboard currently displays Quality Gate: Passed.
• Local Docker image created.
• Local Docker deployment tested successfully through the health and salary endpoints.

Outstanding issue – Docker Hub push

Jenkins Docker Hub authentication is currently failing with `unauthorized: incorrect username or password`. The local Docker image exists, but the image has not yet been verified as pushed to Docker Hub. Therefore, Docker Hub publishing and the final end-to-end pipeline success are not claimed as completed.

Quality Gate timing note

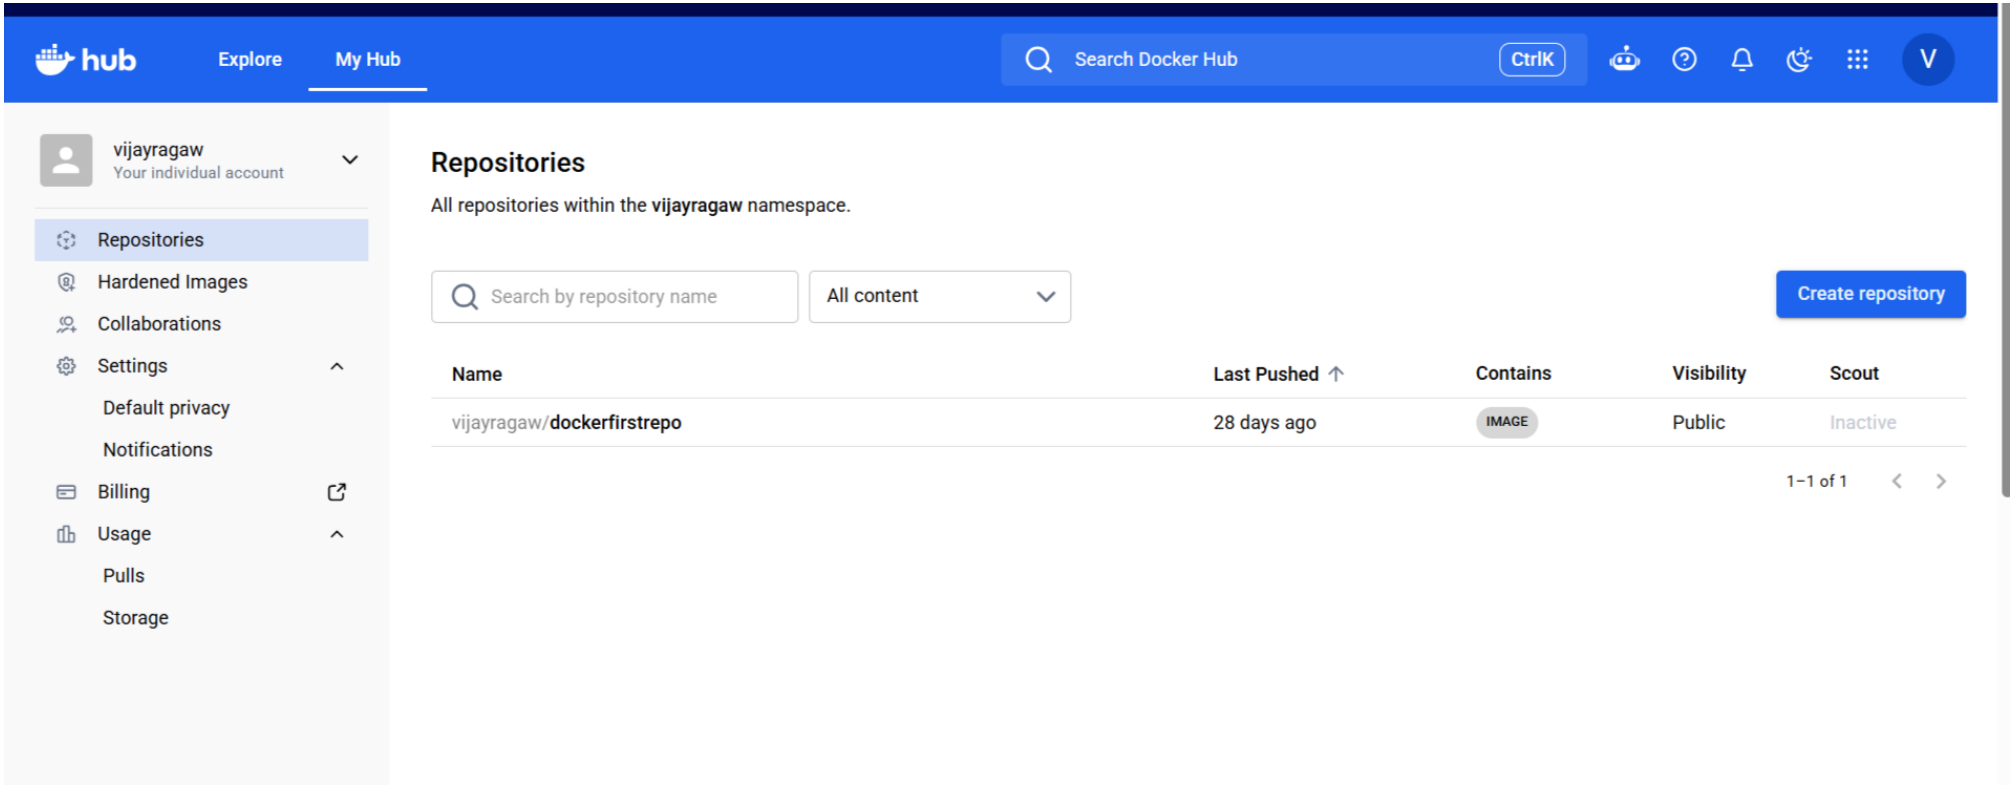

The SonarQube dashboard screenshot shows a Passed Quality Gate. The Jenkins build #21 console screenshot was captured while the pipeline was still waiting for the Quality Gate callback and showed PENDING at that moment.

Evidence screenshots

The following pages present the configuration and test evidence in workflow order.

1. GitHub repository

The Week 12 project repository is available on GitHub. This is the source repository used by the Jenkins pipeline.

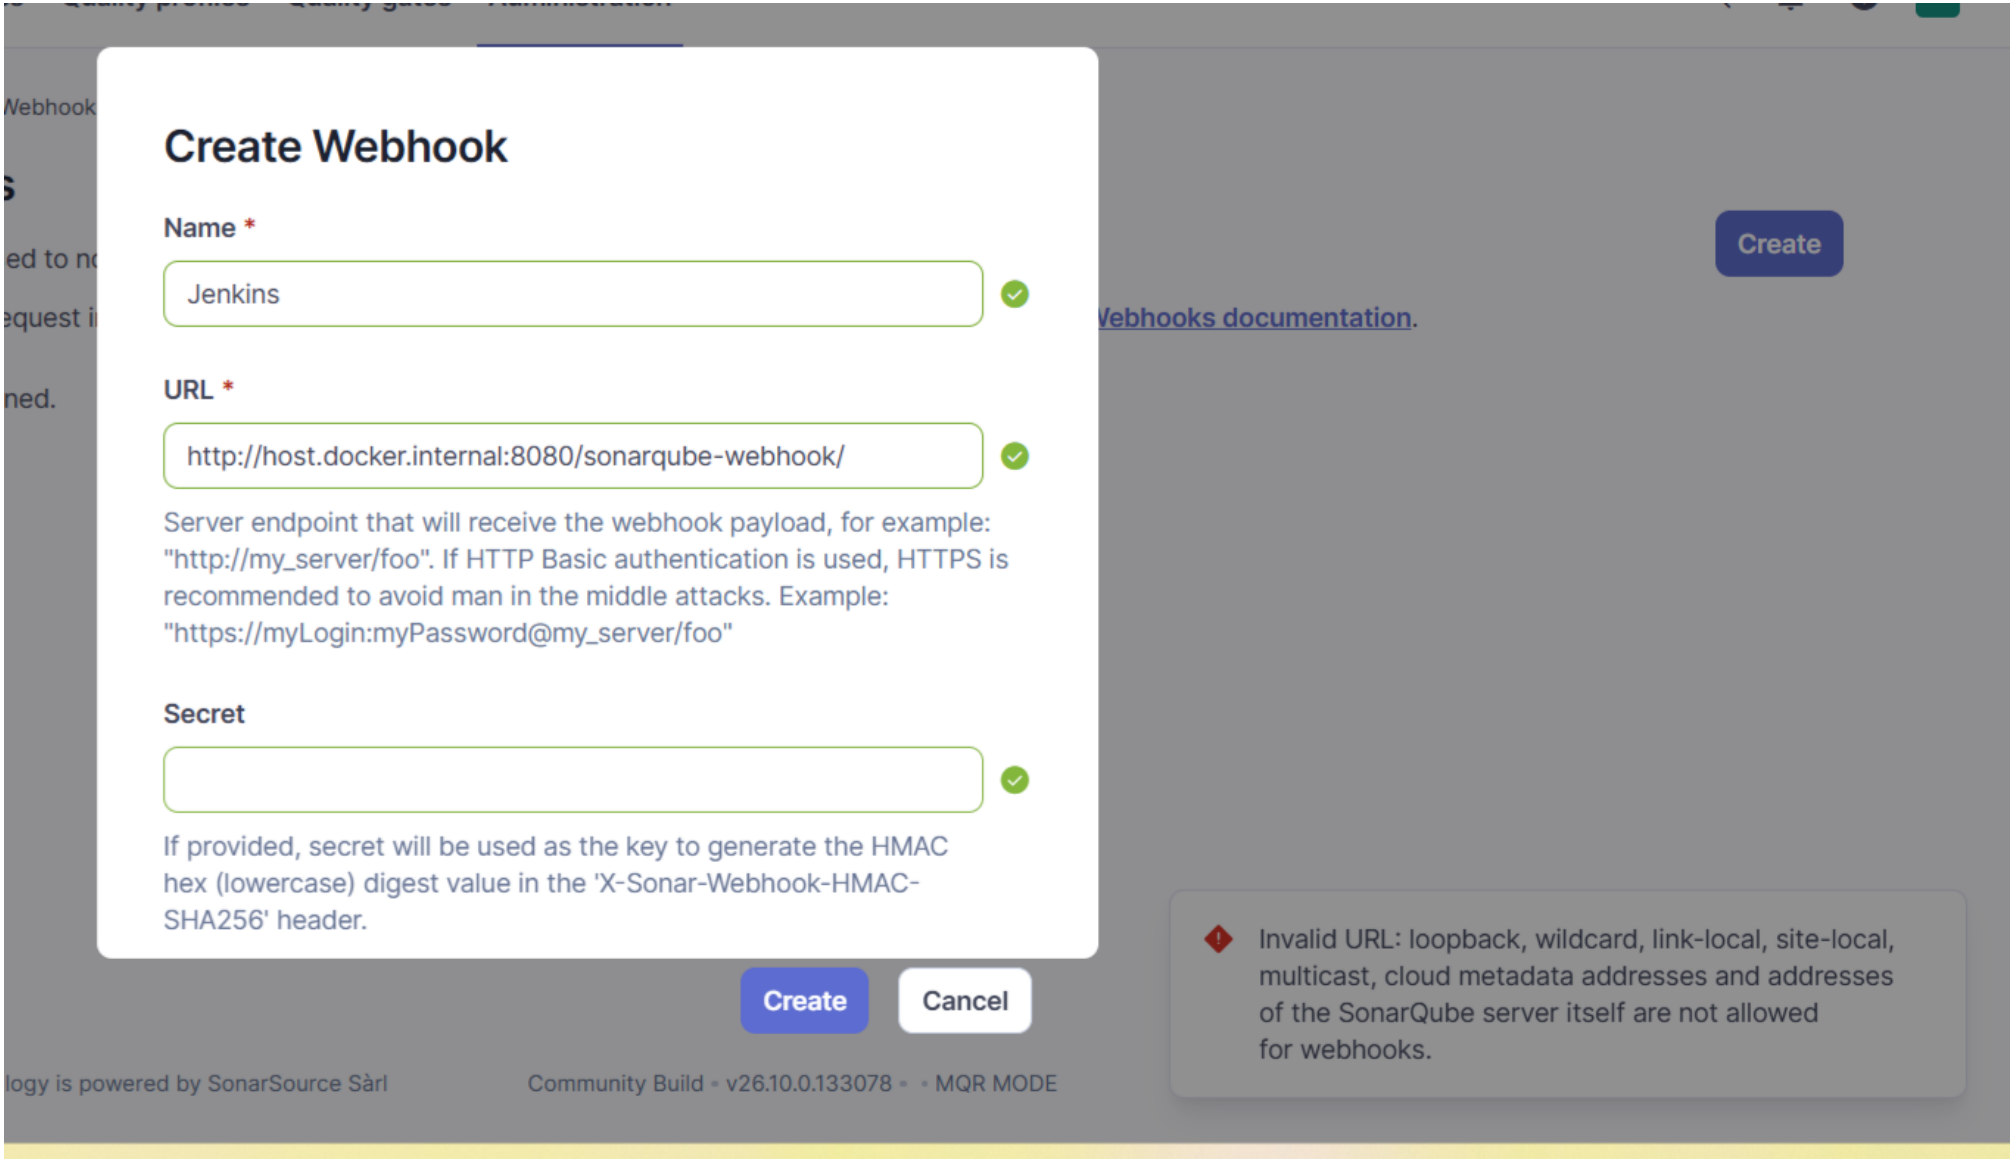

2. Jenkins pipeline source configuration

Jenkins is configured to retrieve the project from the GitHub repository and use the main branch with the Jenkinsfile as the pipeline definition.

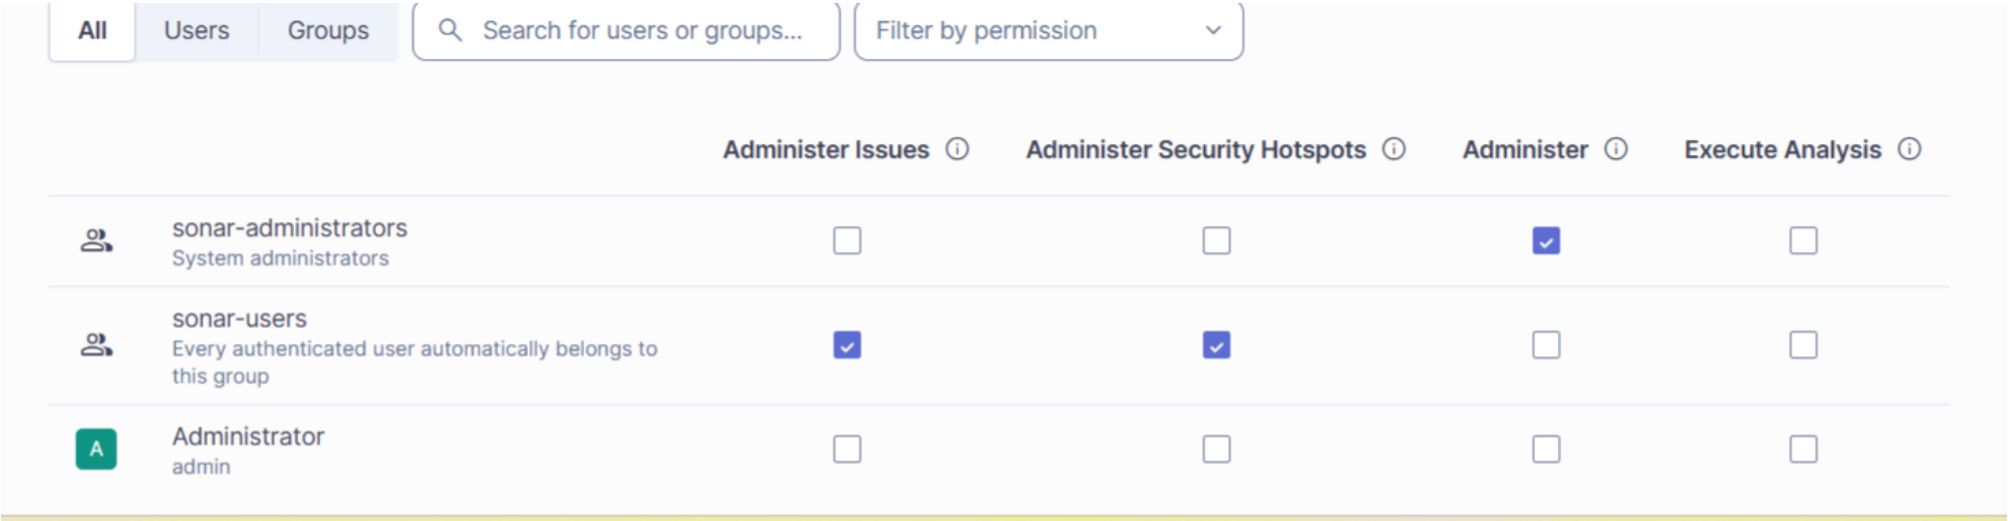

3. GitHub webhook configuration

A GitHub webhook was configured to notify Jenkins about repository events. The webhook setup is included as configuration evidence.

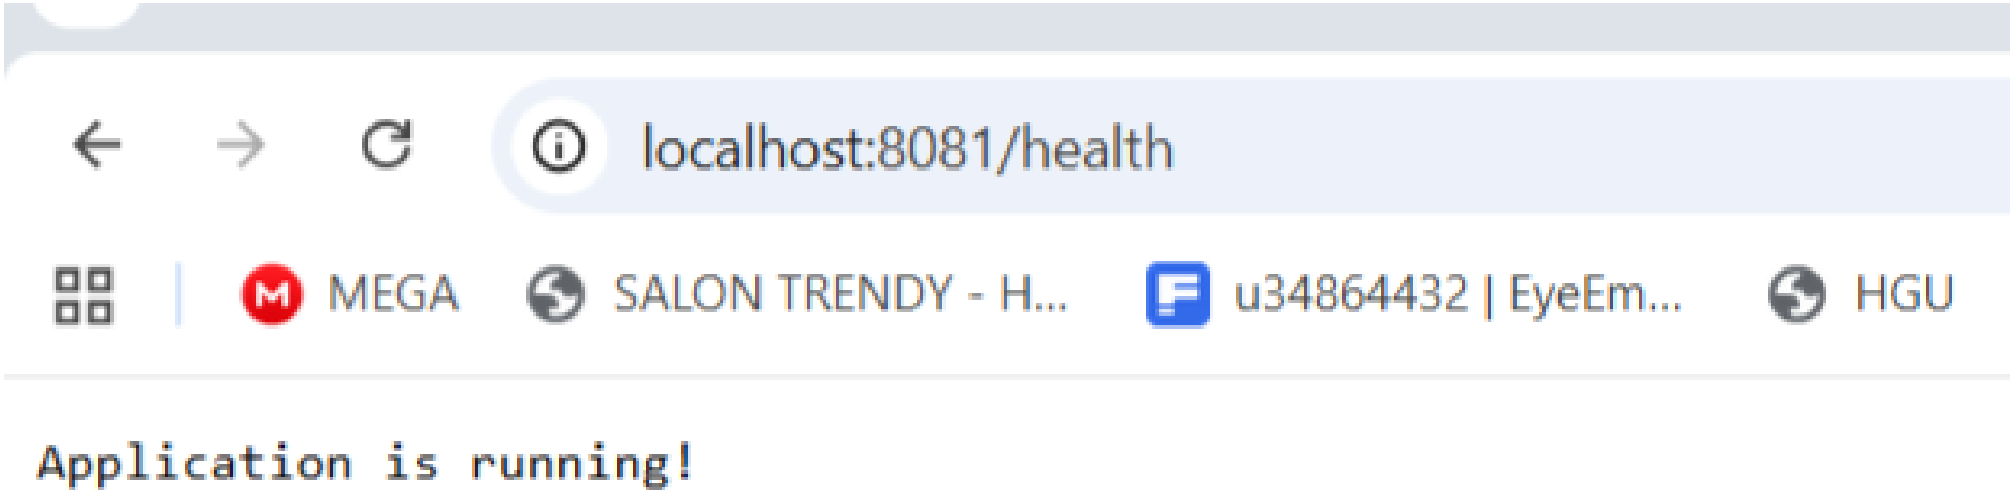

4. Jenkins role-based access configuration

The Jenkins authorization matrix shows role/user permissions configured for access control.

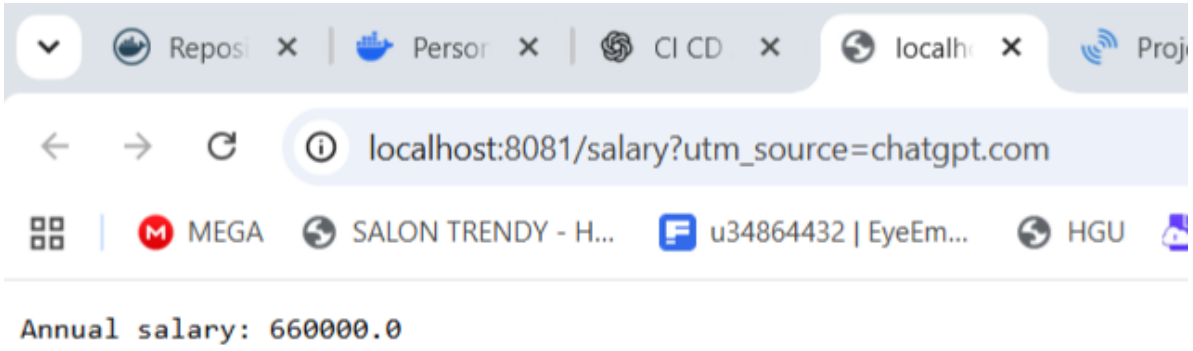

5. Application health endpoint

The application was deployed locally in Docker and the health endpoint responded successfully at http://localhost:8081/health.

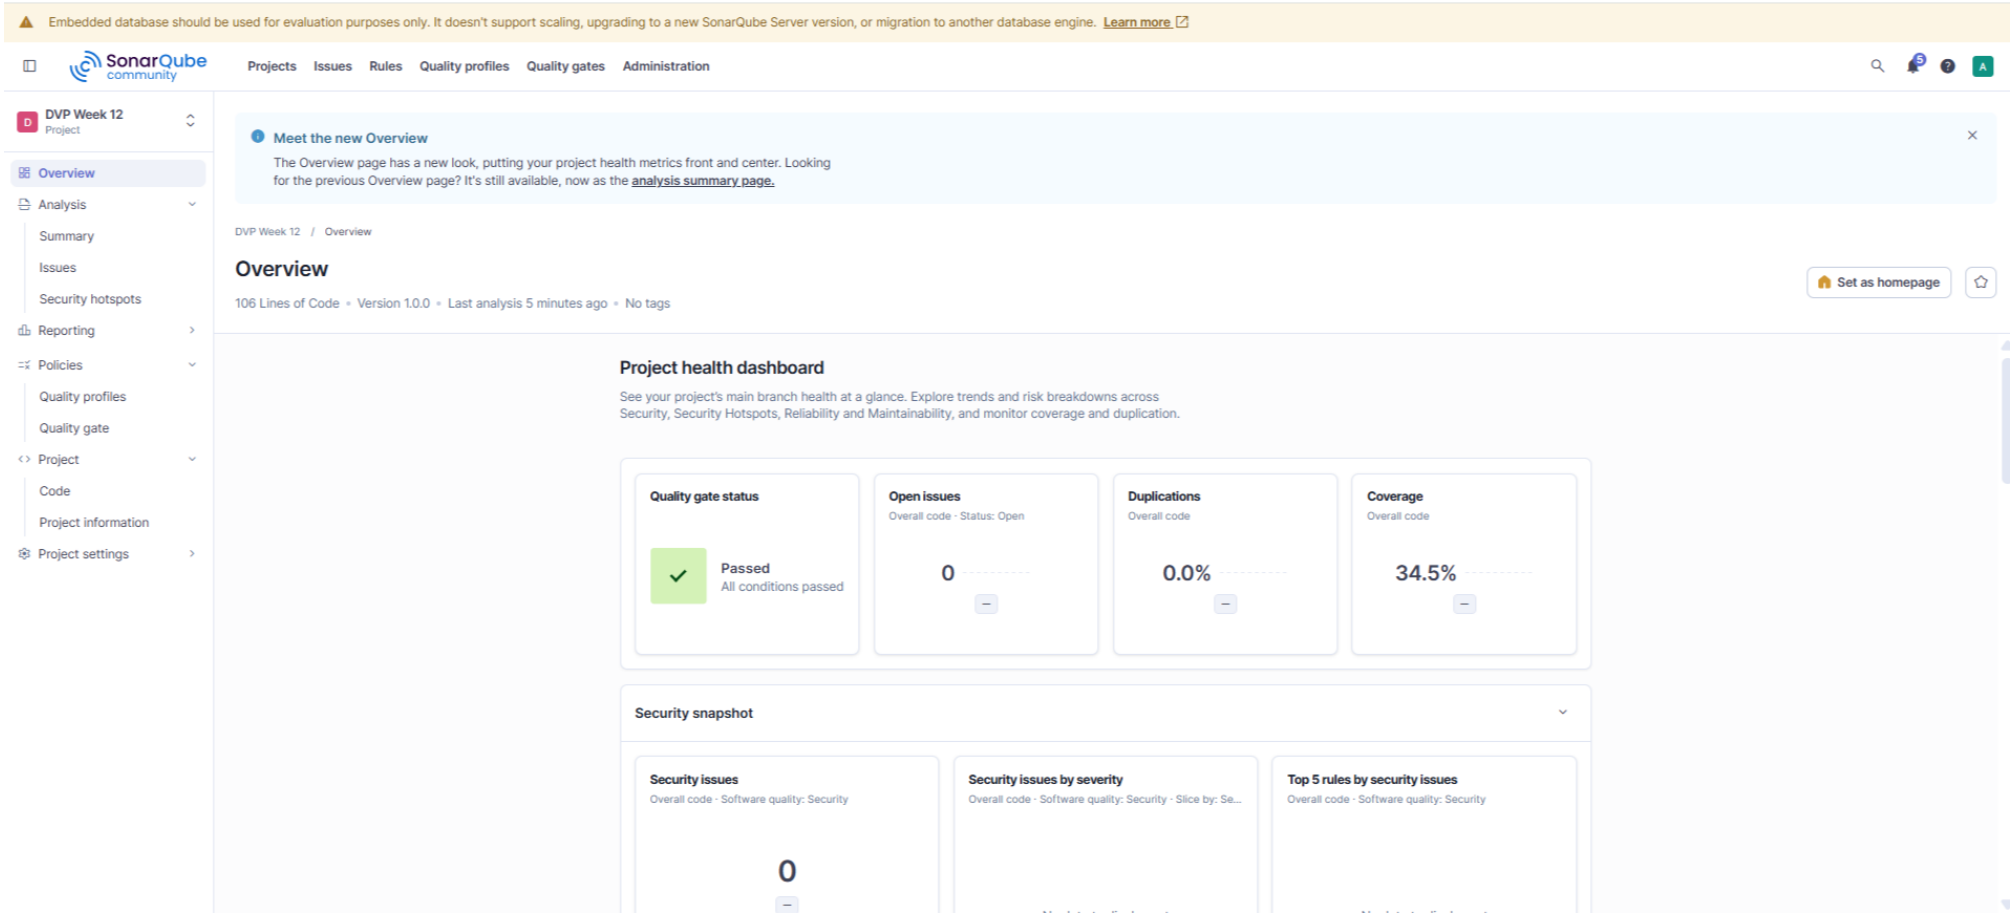

6. Application salary endpoint

The salary endpoint responded successfully at http://localhost:8081/salary, demonstrating that the deployed application is serving requests.

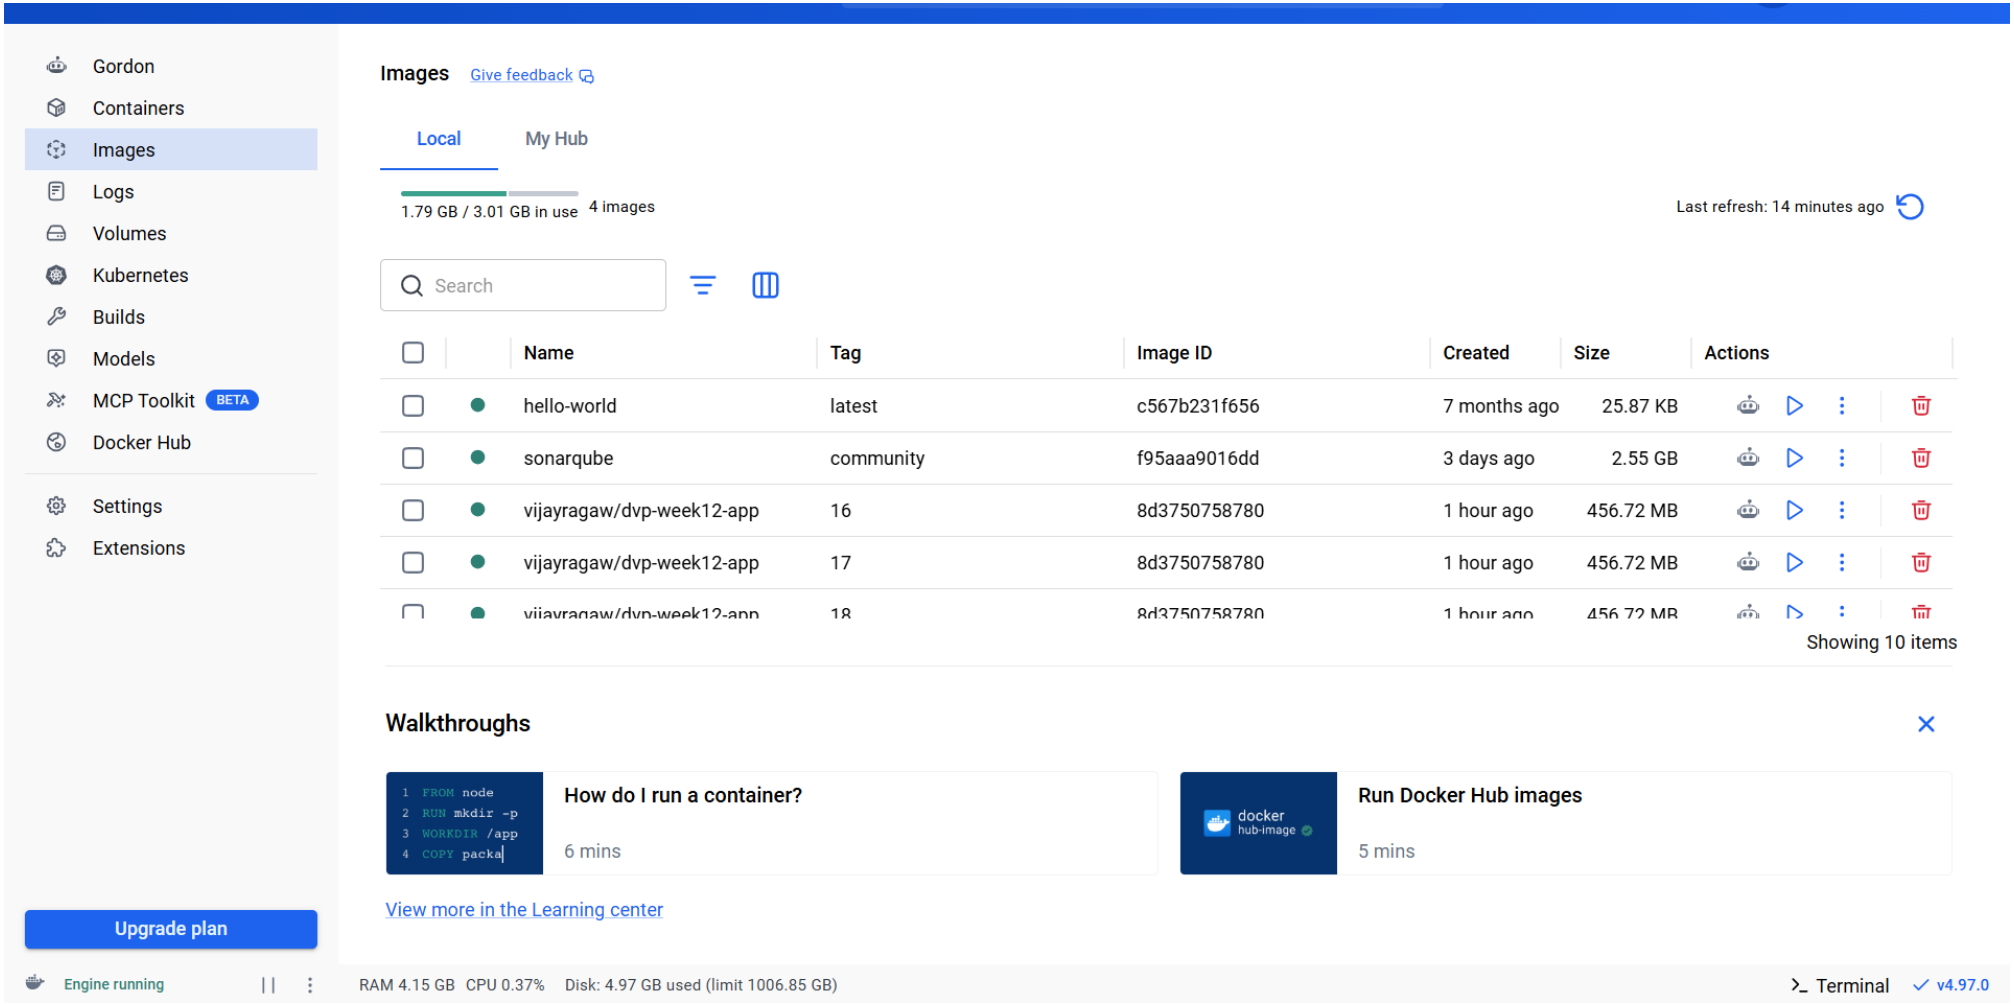

7. SonarQube project overview

The SonarQube dashboard for DVP Week 12 shows Quality Gate: Passed, 0 open issues, 0.0% duplications, and 34.5% code coverage.

8. Docker Desktop local images

Docker Desktop shows the locally built image vijayragaw/dvp-week12-app with tags 16, 17, and 18. These are local images; this screenshot does not confirm a Docker Hub upload.

9. Jenkins build #21 – SonarQube analysis

The Jenkins console confirms SonarScanner analysis completed successfully and Maven reported BUILD SUCCESS. At the time of this screenshot, Jenkins was still waiting for the SonarQube Quality Gate callback (PENDING).
